Summary

In this project we talk how the bilingualism influence in technology, nowadays we are conscious of technology jobs require at least some basic knowledges in this language, in english almost everything is in english, we cant find reports, tutorials, manuals and source in software developer case.

For the previus reasons we can show how the bilingualist is so strong in this project, our project wanna reflect the english language importance and the big advantages when you get a second language.

Tecnical Report

In this Project we have made a technical Project that integrate some subjects such as programming logic, operative systems, hardware introduction and this one, english, the target is show the knowledges for every subject.

First programming logic, the target will be build a website that show some knowledges, for example manuals about install five different operative systems. Our website is build with technologies such as HTML5, CSS3, and JavaScript, in this case we didn't use backend technology because we think that, in this case is not necessary use a backend technology, because the logic and the control under resources such as images, files and videos, we can control this ones with JavaScript, also we use too Bootstrap 5 for better styles and appearance, google icons, of course we don't use neither databases, is not necessary, and finally we use git pages for publish the website.

In the case for operative systems we need five different types of operative systems manuals, we make manual for Ubuntu, Kali Linux, Fedora, Oracle and CentOS, we have to make a glosary with all words reference to the subject, and finally a video about installing a operative system.

Then we have to make a video about preventive maintenance, in this video we explain, ¿how we do every step for the maintenance?, we include a glosary with all words about this subject, this is for hardware introduction.

And last subject with english we have to make a video explain what, how and what do for this project, this explanation will be in english also a technical report in english too.

Last thing that we explain here is this project we make it, because we wanna show how influence the bilingualism in the technology today, why is so important get a second language in this case, english.

Today in technology área in Jobs such as software developer, devops, qa test analys and other Jobs the most important is read, write and understand english because today everything is in english.

This is our integrator project that show our advance throught this semester.
